

Outline

- UI Design processes
 - Waterfall model
 - Iterative design
 - Spiral model
 - User-centered design
- UI Design principles and rules
- UI Hall of Fame or Shame

10/3/22

Waterfall Model Problems

- Users are not involved in evaluation until acceptance testing
- UI problems result in changes in requirements and design
 - Waste of effort spent earlier
- Inflexible partitioning of the project into distinct stages
 - it is difficult to respond to changing customer requirements
- It is only appropriate when the requirements are wellunderstood
 - $\hfill \square$ Few business systems have stable requirements

10/3/22

Shneiderman's Interactive Systems Lifecycle

Software development lifecycle for interactive systems:

- 1 Collect Information
- Define Requirements and Semantics
- 3. Design Syntax and Support Facilities
- 4. Specify Physical Devices
- 5. Develop Software
- 6. Integrate System and Disseminate to Users
- 7. Nurture the User Community
- 8. Prepare Evolutionary Plan

10/3/22

10/3/22

5

Shneiderman's Interactive Systems Lifecycle

3. Design syntax and support facilities

- Compare alternative display formats
- Design informative feedback for each operation
- Review, evaluate, and revise design specifications
- Carry out paper-and-pencil pilot tests or field studies with an online mock-up or prototype

4. Specify physical devices

- Choose hard- or softcopy devices
- Select audio, graphics, or peripheral devices
- Consider work environment noise, lighting, table space, etc.
- Carry out further pilot tests and revise design

(1)

Shneiderman's Interactive Systems Lifecycle

1. Collect Information

- Organize the design team
- Obtain management and customer participation
- Conduct interviews with users
- Submit written questionnaires to users
- Estimate development, training, usage, maintenance costs
- Prepare a schedule with observable milestones and reviews

Define requirements and semantics

- Define high-level goals and middle-level requirements
- Consider task flow sequencing alternatives
- Create task objects and actions
- Obtain management and customer agreement on goals, requirements, and semantic design

10/3/22

Shneiderman's Interactive Systems Lifecycle

5. Develop software

- Use appropriate development tools
- Develop code
- Perform unit test

Integrate system and disseminate to users

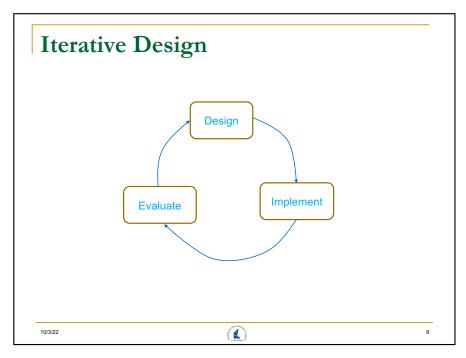

- Assure user involvement at every stage
- Conduct acceptance tests and fine tune the system
- User documentation and training

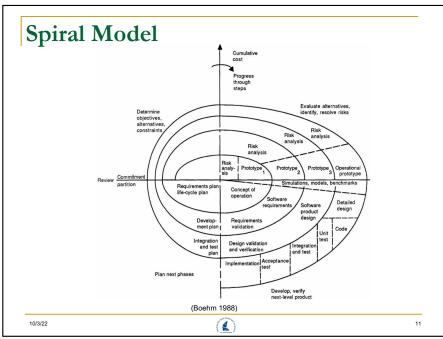

7. Nurture the user community

- User support
- Monitor usage and measurement
- Prepare evolutionary plan

10/3/22

Interactive Design (cont'd)

- Each cycle is one iteration
- Release is produced at the end of each iteration
- Customer's feedback and evaluations can be incorporated into next release
- Problems
 - It's expensive to use customer's time to test
 - Customers may not be available
 - □ Customers don't like → they don't buy

10/3/22

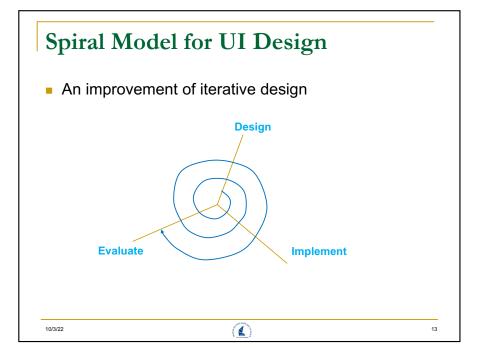

Spiral Model (cont'd)

- Process is represented as a spiral rather than as a sequence of activities with backtracking
- Each loop in the spiral represents a phase in the process
- No fixed phases such as specification or design loops in the spiral are chosen depending on what is required
- Risks are explicitly assessed and resolved throughout the process

10/3/22

1

User-Centered Design

- Also known as Participatory Design
- A type of iterative design with Spiral
- Focusing on users and tasks
 - User analysis: who uses the system
 - Task analysis: what users need to do
- Getting users involved in the process
 - Users as evaluators, consultants and designers (sometimes)
- Constant evaluation

10/3/22

Users evaluate prototypes and releases

15

Spiral Model for UI Design (cont'd)

- Early cycles use cheap prototypes
 - Paper prototypes
 - Sketches on computer
 - Quick prototyping tools
- Providing multiple prototype alternatives
 - Parallel prototyping
- Later cycles should be better than early ones
- Only mature releases of later cycles can be distributed to users

10/3/22

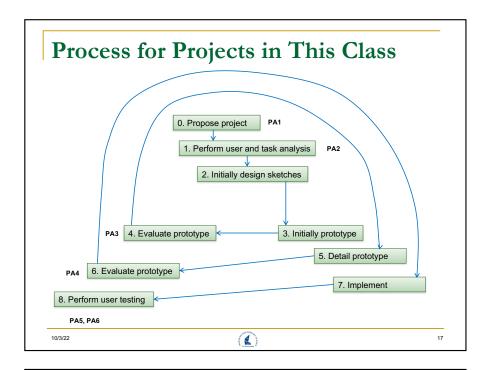

User-Centered Design (cont'd)

- Advantages
 - Accurate information and useful suggestions
 - Opportunity to argue over design decisions
 - Increased ego involvement in system success
- Potential problems
 - Users are not always available to participate
 - Their time maybe expensive
 - Users are not UI designers
 - Users have strong ego and preferences
 - UI designers overly obey users' preferences

10/3/22

1

How to be successful in teamwork?

- Define clear goals and expectations
- Assign clear responsibilities and tasks for everyone
- Talk about accountability
 - Who is responsible when things go wrong
- Meet weekly to review status, even if no assignment is due that week
 - Record meeting minutes
- Work early than late
- Understand your teammates
 - Motivation, commitment, capability

Applying User-centered Design

- You are all potential users of proposed apps
- Users help identify problems
 - Members of other groups review a group's proposal
 - Collect feedback from potential users
 - Observer existing users' actions
- Users review and provide feedback
 - In each milestones, members of other groups provide feedback on design of a group
- User evaluation
 - By the end of the project: everyone will review the design of another group

3/22

Outline

- UI Design processes
 - Waterfall model
 - Iterative design
 - Spiral model
 - User-centered design
- UI Design principles and rules
- UI Hall of Fame or Shame

10/3/22

Principles

- Use Shneiderman's eight golden rules of interface design
 - To be discussed in the next slide
- Prevent errors
 - Constructive and informative error messages
 - Organizing screens and menus functionally
 - Providing feedback about the state of the interface
 - Correct actions
 - E.g., grayed menu items
 - Complete sequences
 - E.g., wizard windows often have both Next and Finish buttons
- Increase automation while preserving human control
 - Auto suggestion
 - Auto completion

10/3/22

Allowing users to change

(1

Principles

- Determine users' skill levels
 - Novice/first-time users
 - Knowledgeable intermittent users
 - Experts and frequent users
- Identify the tasks
 - Frequent actions
 - Less frequent actions
 - Infrequent actions
- Choose appropriate interaction styles
 - Direct manipulation
 - Menu selection
 - Form fillin
 - Command language
 - Natural language

10/3/22

Shneiderman's Eight Golden Rules

- Strive for consistency
- Cater to universal usability
- Offer informative feedback
- Design dialogs to yield closure
- Prevent errors, rapid recovery
- Permit easy reversal of actions
- Support user control
- Reduce memory load

10/3/22

Summary

- User-centered design is a preferable process in UI design
- Groups in this class follow this process
- UI design principles and rules
 - Discussed across the lectures including this one
